

H2O 101

An Easy Guide to Teaching Your Children About Water Conservation

The earth has more than 325 trillion gallons of water on it, but less than 2% of that is usable by people. It's important to get your kids in a water saving mindset at a young age and develop lifelong habits.

Here are 4 steps to help you teach your children about water conservation.

STEP 1: EDUCATE

Education is the key to sustainability. Teaching your children about the basics and importance of water conservation is the foundation to a lifelong lifestyle that can save the planet. Provide them with a purpose behind the actions they are taking to conserve water.

STEP 2: CHECKLISTS

To continue your kids on the path to water conservation, use checklists in certain areas of the house (kitchen, bathroom, etc.) as a quick and simple reminder for them to start participating in water saving actions. Put them on your fridge, stick them on the bathroom mirror or any other place where your children will be reminded of the many things they can do to save water around the house. Create your own checklists or use the ones we have created.

STEP 3: DEVELOP HABITS

As your child becomes more familiar with the items on the checklists around the house, they will start to develop good water saving habits. Developing these habits at a young age will create a certain mindset in your child that they will remember forever. Once a child develops that mindset, you can introduce more water saving tactics into their lives and turn that mindset into a lifestyle.

STEP 4: PARTICIPATE

Practice indoor and outdoor water saving activities with your children to make water conservation fun!

Some activities include:

- Practice smart gardening with your kids by installing a starter kit. Go to www.digcorp.com view our full line of easy-to-install drip irrigation kits.
- Think of new and creative ways to use water in multiple ways, such as using the water you use to wash your produce to water your lawn.
- Join water conservation organizations like www.saveourh2o.org with your child to immerse them in an environment that promotes saving water.

The time is now to join the water conservation movement and save our earth. Your child, along with future generations, have the power to make a real difference on our planet.
